

## CALCULATION

The maths work your child is doing at school may look very different to the kind of 'sums' you remember. This is because children are encouraged to work mentally, where possible, using personal jottings to help support their thinking. Even when children are taught more formal written methods (from late year 3 onwards), they are only encouraged to use these methods for calculations they cannot solve in their heads.

Discussing the efficiency and suitability of different strategies is an important part of maths lessons.

## SHAPES AND MEASURES

* Choose a shape of the week e.g. cylinder. Look for this shape in the environment (tins, candles etc). Ask your child to describe the shape to you (2 circular faces, 2 curved edges ..)
* Play 'guess my shape'. You think of a shape. Your child asks questions to try to identify it but you can only answer 'yes' or 'no' (e.g. Does it have more than 4 corners? Does it have any curved sides?)
* Hunt for right angles around your home. Can your child also spot angles bigger or smaller than a right angle?
* Look for symmetrical objects. Help your child to draw or paint symmetrical pictures / patterns?
* Make a model using boxes/containers of different shapes and sizes. Ask your child to describe their model.
* Practise measuring the lengths or heights of objects (in metres or cm ). Help your child to use different rulers and tape measures correctly. Encourage them to estimate before measuring.
* Let your child help with cooking at home. Help them to measure ingredients accurately using weighing scales or measuring jugs. Talk about what each division on the scale stands for.
* Choose some food items out of the cupboard. Try to put the objects in order of weight, by feel alone. Check by looking at the amounts on the packets.
* Practise telling the time with your child. Use both digital and analogue clocks. Ask your child to be a 'timekeeper' (e.g. tell me when it is half past four because then we are going swimming).
* Use a stop clock to time how long it takes to do everyday tasks (e.g. how long does it take to get dressed?). Encourage your child to estimate first.

## PRACTISING NUMBER FACTS

> Find out which number facts your child is learning at school (addition facts to 10, times tables, doubles etc). Try to practise for a few minutes each day using a range of vocabulary.
>Have a 'fact of the day'. Pin this fact up around the house. Practise reading it in a quiet, loud, squeaky voice. Ask your child over the day if they can recall the fact.
$>$ Play 'ping pong' to practise complements with your child. You say a number. They reply with how much more is needed to make 10. You can also play this game with numbers totalling 20,100 or 1000 . Encourage your child to answer quickly, without counting or using fingers.
> Throw 2 dice. Ask your child to find the total of the numbers ( + ), the difference between them (-) or the product ( $x$ ). Can they do this without counting?
> Use a set of playing cards (no pictures). Turn over two cards and ask your child to add or multiply the numbers. If they answer correctly, they keep the cards. How many cards can they collect in 2 minutes?
> Play Bingo. Each player chooses five answers (e.g. numbers to 10 to practise simple addition, multiples of 5 to practise the five times tables). Ask a question and if a player has the answer, they can cross it off. The winner is the first player to cross off all their answers.
> Give your child an answer. Ask them to write as many addition sentences as they can with this answer (e.g. $10=\square+\square$ ). Try with multiplication or subtraction.
$>$ Give your child a number fact (e.g. 5+3=8). Ask them what else they can find out from this fact (e.g. $3+5=8,8-5=3,8$ $3=5,50+30=80,500+300=800,5+4=9,15+3=18$ ). Add to the list over the next few days. Try starting with $a \times$ fact as well.

## When faced with a calculation problem, encourage your child to ask...

* Can I do this in my head?
* Could I do this in my head using drawings or jottings to help me?
* Do I need to use a written method?
* Should I use a calculator?

Also help your child to estimate and then check the answer. Encourage them to ask...

Is the answer sensible?

## ADDITION

Children are taught to understand addition as combining two sets and counting on.

## $2+3=$

At a party, I eat 2 cakes and my friend eats 3.
How many cakes did we eat altogether?

## 7+4=

7 people are on the bus. 4 more get on at the next stop. How many people are on the bus now?

## 47+25=

My sunflower is 47 cm tall. It grows another 25 cm . How tall is it now?

or

Children could draw a picture to help them work out the answer.

Children could use dots or tally marks to represent objects (quicker than drawing a picture)

Drawing an empty number line helps children to record the steps they have taken in a calculation (start on 47, +20 , then +5 ). This is much more efficient than counting on in ones.

## REAL LIFE PROBLEMS

* Go shopping with your child to buy two or three items. Ask them to work out the total amount spent and how much change you will get.
* Buy some items with a percentage extra free. Help your child to calculate how much of the product is free.
* Plan an outing during the holidays. Ask your child to think about what time you will need to set off and how much money you will need to take.
* Use a TV guide. Ask your child to work out the length of their favourite programmes. Can they calculate how long they spend watching TV each day / each week?
* Use a bus or train timetable. Ask your child to work out how long a journey between two places should take? Go on the journey. Do you arrive earlier or later than expected? How much earlier/later?
* Help your child to scale a recipe up or down to feed the right amount of people.
* Work together to plan a party or meal on a budget.

These are just a few ideas to give you a starting point. Try to involve your child in as many problem-solving activities as possible. The more 'real' a problem is, the more motivated they will be when trying to solve it.

## COUNTING IDEAS

(-) Practise chanting the number names.
Encourage your child to join in with you. When they are confident, try starting from different numbers - 4, 5, 6...
(0) Sing number rhymes together - there are lots of commercial tapes and CD's available.
(0) Give your child the opportunity to count a range of interesting objects (coins, pasta shapes, buttons etc.). Encourage them to touch and move each object as they count.
(0) Count things you cannot touch or see (more difficult!!). Try lights on the ceiling, window panes, jumps, claps or oranges in a bag.
© Play games that involve counting (e.g. snakes and ladders, dice games, games that involve collecting objects).
© Look for numerals in the environment. You can spot numerals at home, in the street or when out shopping.
(0) Cut out numerals from newspapers, magazines or birthday cards. Then help your child to put the numbers in orders.
© Make mistakes when chanting, counting or ordering numbers. Can your child spot what you have done wrong?
(-) Choose a number of the week e.g. 5. Practise counting to 5 and on from 5. Count out groups of 5 objects ( 5 dolls, 5 bricks, 5 pens). See how many places you can spot the numeral 5 .

## ADDITION

## 487+546=

There are 487 boys and 546 girls in a school. How many children are there altogether?

$$
546
$$

$+487$ 13
120
900
1033

## $12786+2568=$

12786 people visited the museum last year. The numbers increased by 2568 this year. How many people altogether visited this year?

$$
\begin{array}{r}
12786 \\
+\quad 2568 \\
\hline 15354 \\
\hline
\end{array}
$$

Children will be taught written methods for those calculations they cannot do 'in their heads'. Expanded methods build on mental methods and make the value of the digits clear to children. The language used is very important
( $6+7,40+80,500+400$, then $900+120+13$ - add this mentally NOT in columns).

## When children are

confident using the expanded method, this can be 'squashed' into the traditional compact method.

## SUBTRACTION

## Children are taught to understand subtraction as taking away（counting back）and finding the difference（counting up）

## 5－2＝

I had five balloons．Two burst．
How many did I have left？

## A）（2）4，4 <br> Take away

A teddy bear costs $£ 5$ and a doll costs $£ 2$ ．How much more does the bear cost？

Drawing a picture helps children to visualise the problem．

## H｜｜｜l Take away

Lisa has 7 felt tip pens and Tim has 3．How many more does Lisa have？
•・ゃゃゃ・• Find the
$\bullet \bullet \bullet$ difference

## DIVISION

## $84 \div 6=$

I need 6 drawing pins to put up a picture．How many pictures can I put up with 84 pins？

$192 \div 8=$
8 pencils fit in each packet．If you have 192 pencils，how many packets can be filled？

## $184 \div 7=$

I need 184 chairs for a
concert．I arrange them in rows of 7 ．How many rows do I need？

$$
\begin{array}{rr}
184 & \\
-\frac{140}{44} & 20 \text { groups } \\
-\frac{42}{2} & 6 \text { groups } \\
& =26 \mathrm{r} 2
\end{array}
$$

It would take a long time to jump in sixes to 84 so children can jump on in bigger＇chunks＇．A jump of 10 groups of 6 takes you to 60．Then you need another 4 groups of 6 to reach 84．Altogether，that is 14 sixes．

It is helpful to split 192 into sensible＇chunks＇before dividing．As you are dividing by 8 ，the＇chunks＇chosen must also be multiples of 8 ．Divide each ＇chunk＇（how many groups of 8？） and then add the answers together．

This method is known as chunking．In this example，you are taking away chunks of 7 ． First subtract 140 （20 groups of 7 ）and you are left with 44. Then subtract 42 （ 6 groups of 7），to leave 2．Altogether，that is 26 sevens with a remainder of 2 ．

## DIVISION

Children are taught to understand division as sharing and grouping.

## 124=

4 apples are packed in a basket. How many baskets can you fill with 12 apples?

## 287=

A chew bar costs 7 p. How many can I buy with 28p?

More pictures! Drawing often gives children a way into solving the problem.

Dots or tally marks can either be shared out one at a time or split up into groups.

To work out how many 7's there are in 28, draw jumps of 7 along a number line. This shows you need 4 jumps of 7 to reach 28.

## SUBTRACTION

## 84-27=

I cut 27 cm off a ribbon measuring 84 cm . How much is left?

## 834-378=

The library owns 834 books. 378 are out on loan. How many are on the shelves?

22 (400)
400 (800)
34 (834)
456

Children could count back using an empty number line. This is a really good way for them to record the steps they have taken (start on 84, -20, then -7).

Children could count up (from the smallest number to the biggest) using an empty number line. It is easiest to count up to a multiple of 10 or 100 (a friendly number). The steps can also be recorded vertically. This method works really well with any numbers, including decimals!

MULTIPLICATION

## 6×4=

There are 4 cats. Each cat has 6 kittens. How many kittens are there altogether?

## $13 \times 7=$

There are 13 biscuits in a packet. How
many biscuits in 7 packets?

## 6×124=

124 books were sold. Each book cost
£6. How much money was taken?

|  | 100 | 20 | 4 |
| :---: | :---: | :---: | :---: |
| 6 | 600 | 120 | 24 |$=744$

## $72 \times 34=$

A cat is 72 cm long. A tiger is 34 times longer. How long is the tiger?

|  | 70 | 2 |  |
| ---: | ---: | ---: | ---: |
| 30 | 2100 | 60 | $=2160$ |
| 4 | 280 | 8 | $=288$ |
|  |  |  |  |

Children could count on in equal steps, recording each jump on an empty number line. This shows 4 jumps of 6 .

When numbers get bigger, it is inefficient to do lots of small jumps. Split 13 into parts (10 and 3 ). This gives you two jumps (10×7 and $3 \times 7$ ).

This is called the grid method. 124 is split into parts ( 100,20 and 4 ) and each of these is multiplied by 6 . The three answers are then added together.

This method also works for 'long multiplication'. Again split up the numbers and multiply each part. Add across the rows, then add those two answers together.
